

ERD – Asset Management (Mermaid)

This ERD is derived from the repository SQL schema (db/dbv20.sql, db/all_migrations_combined.sql) and canonical backups (db/backups/dbv100, db/dblive3v2.11-5-14-26). It focuses on primary keys, foreign keys, and core business fields.

Full System ERD (Paginated for PDF)

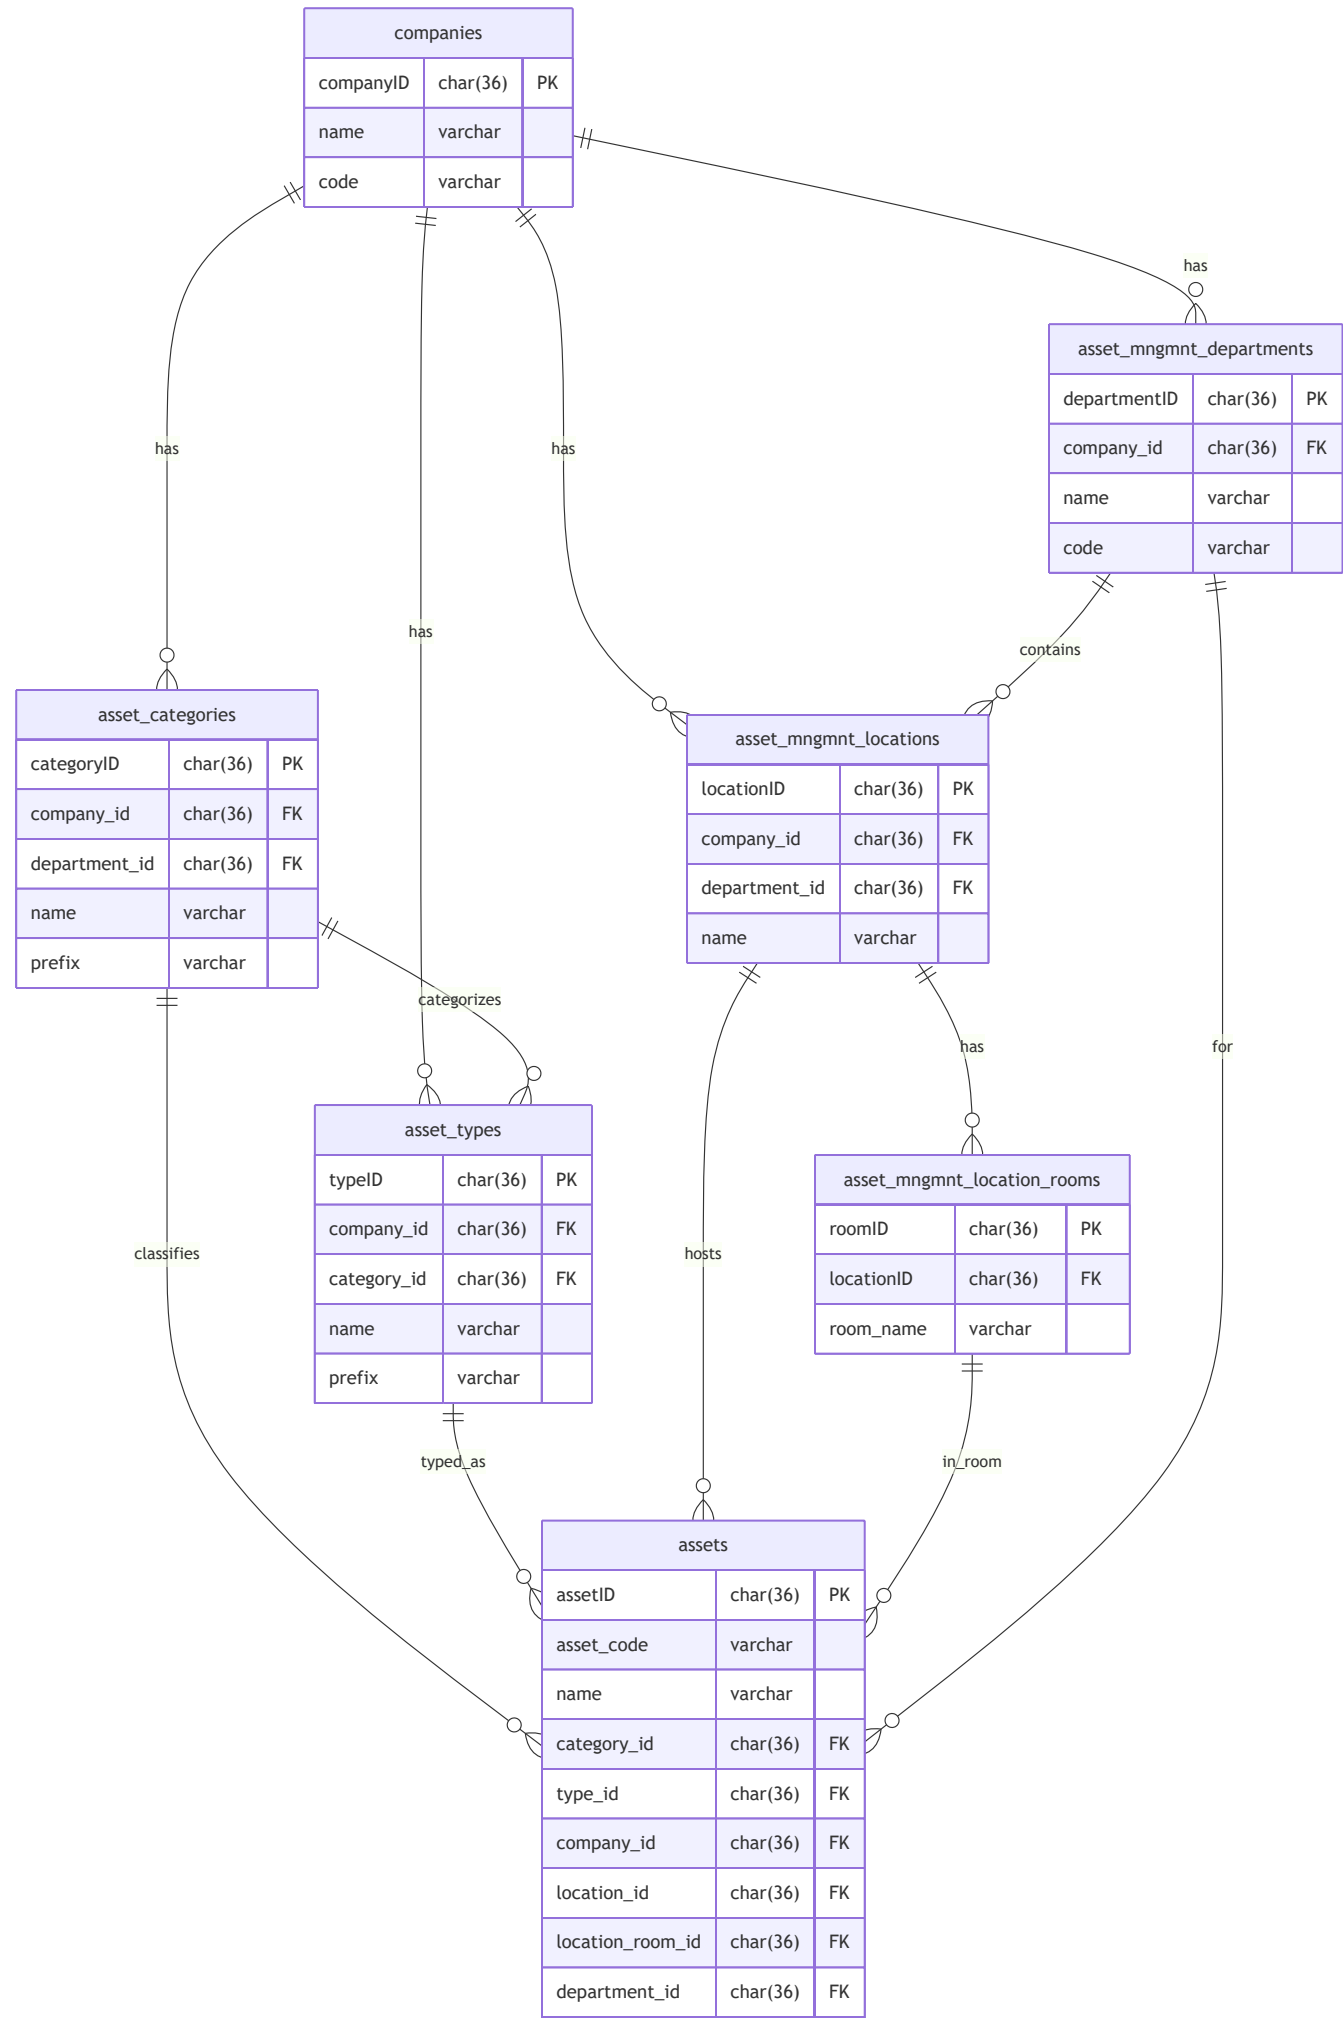

0) Master Relationship Map

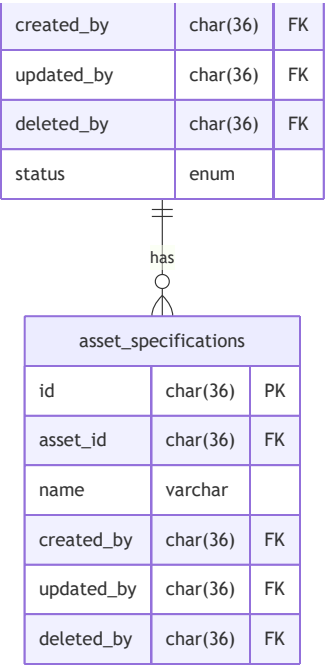

Notes:

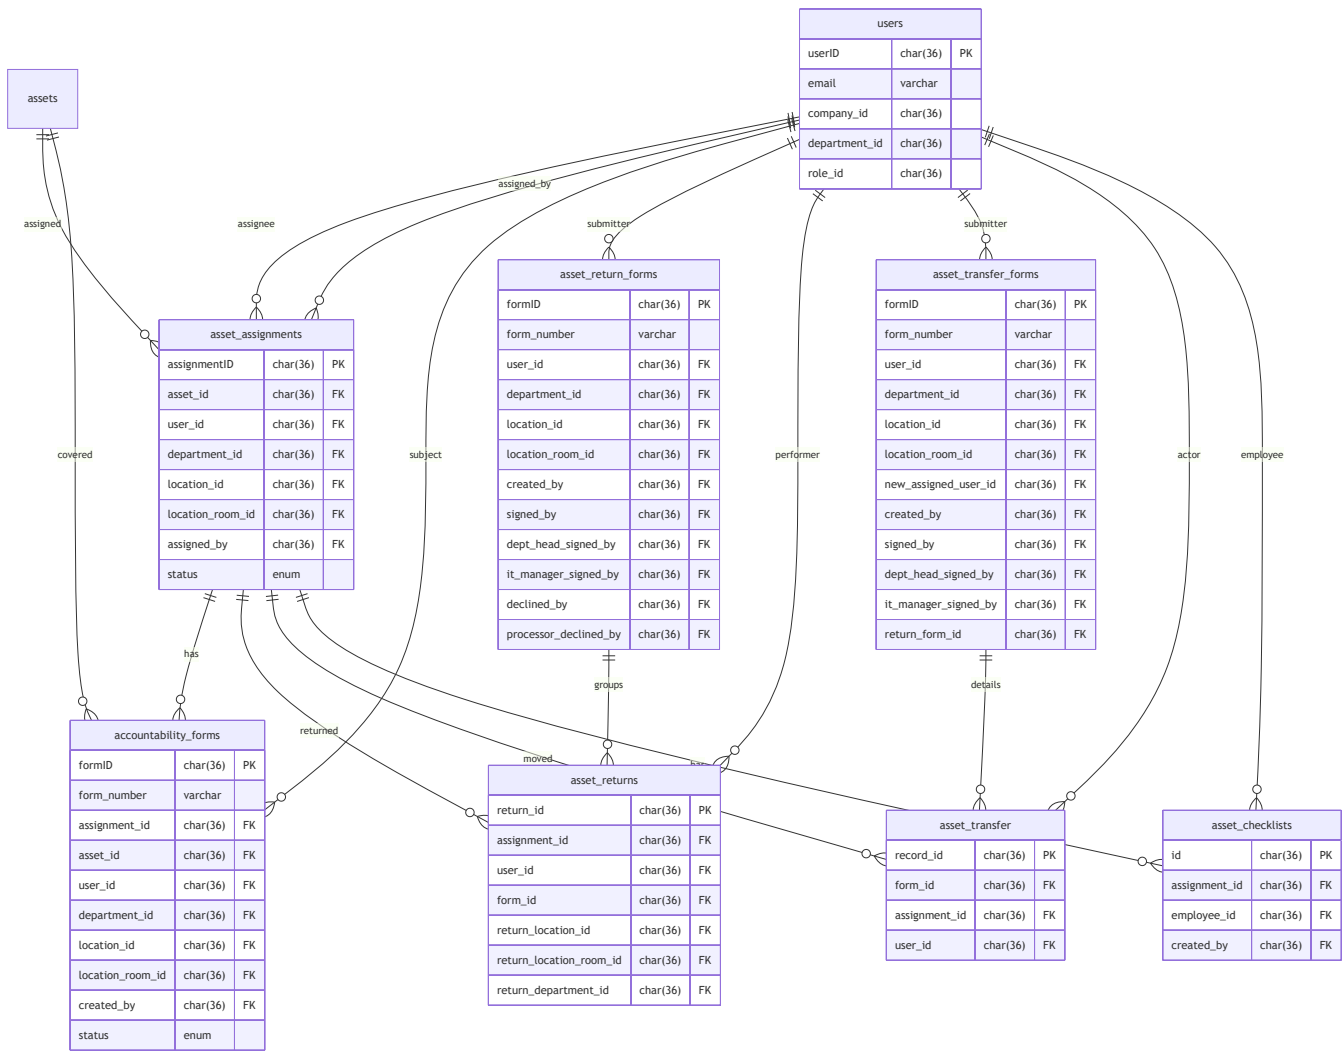

- Some columns such as `users.role_id` are present but not always declared with an explicit FK in the dumps; they are treated as logical associations where applicable.

1) Catalog and Asset Core

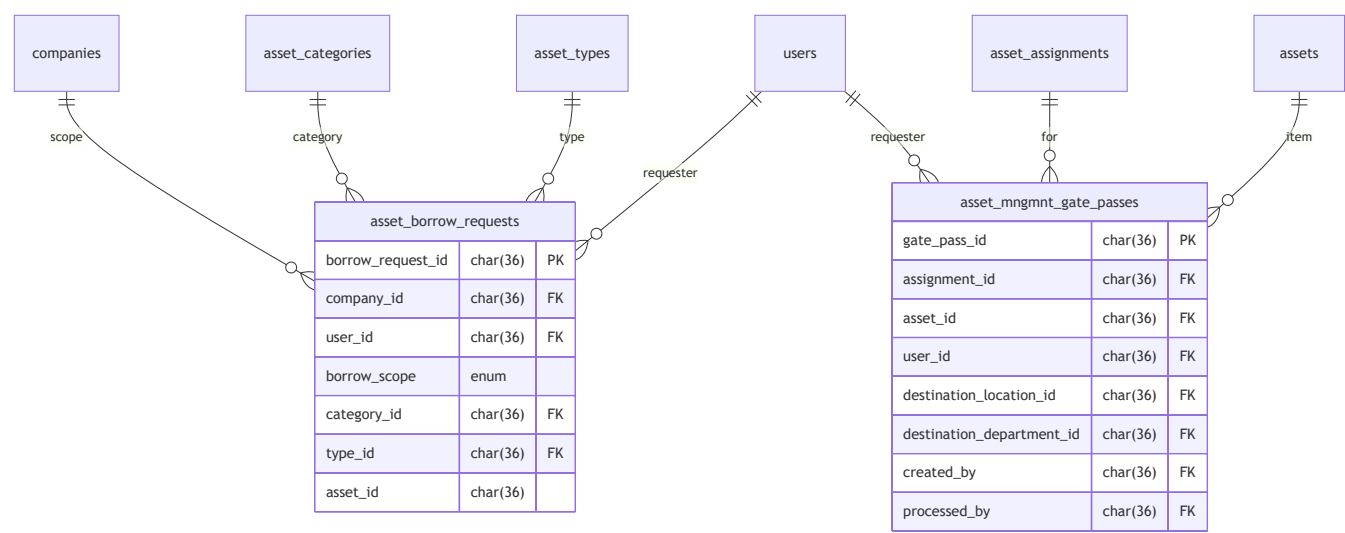

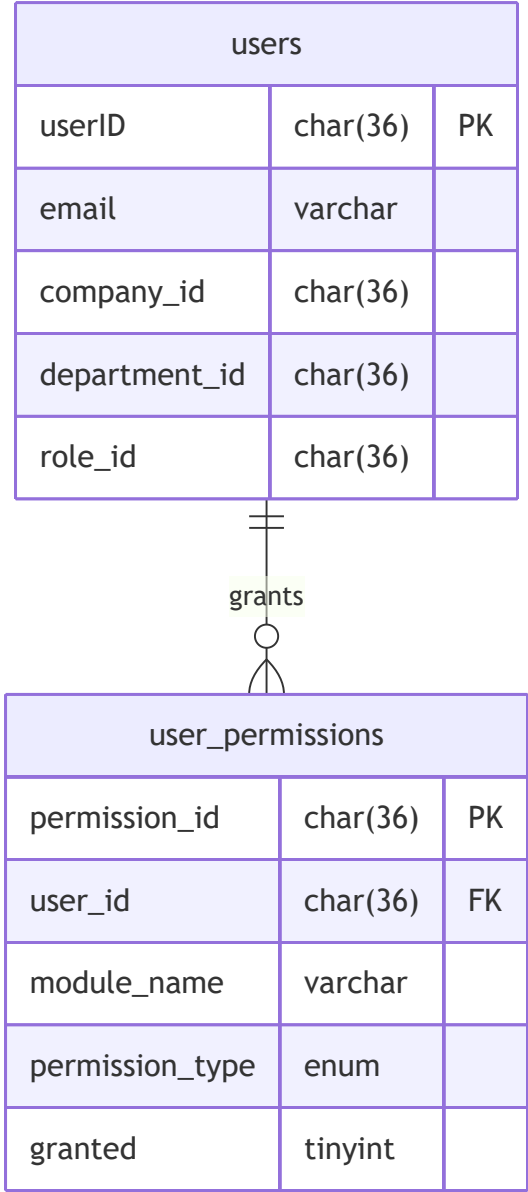

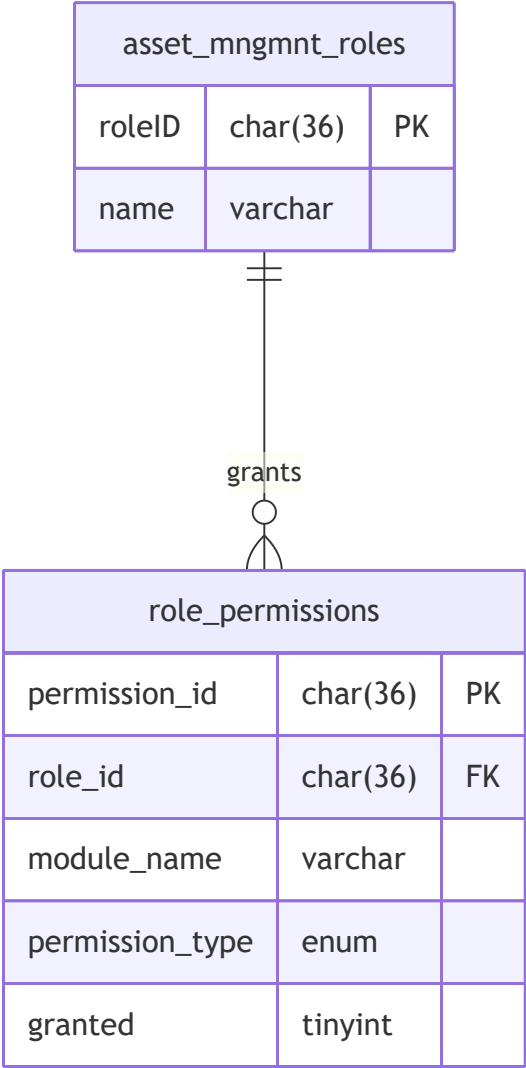

2) Assignments and Lifecycle Forms

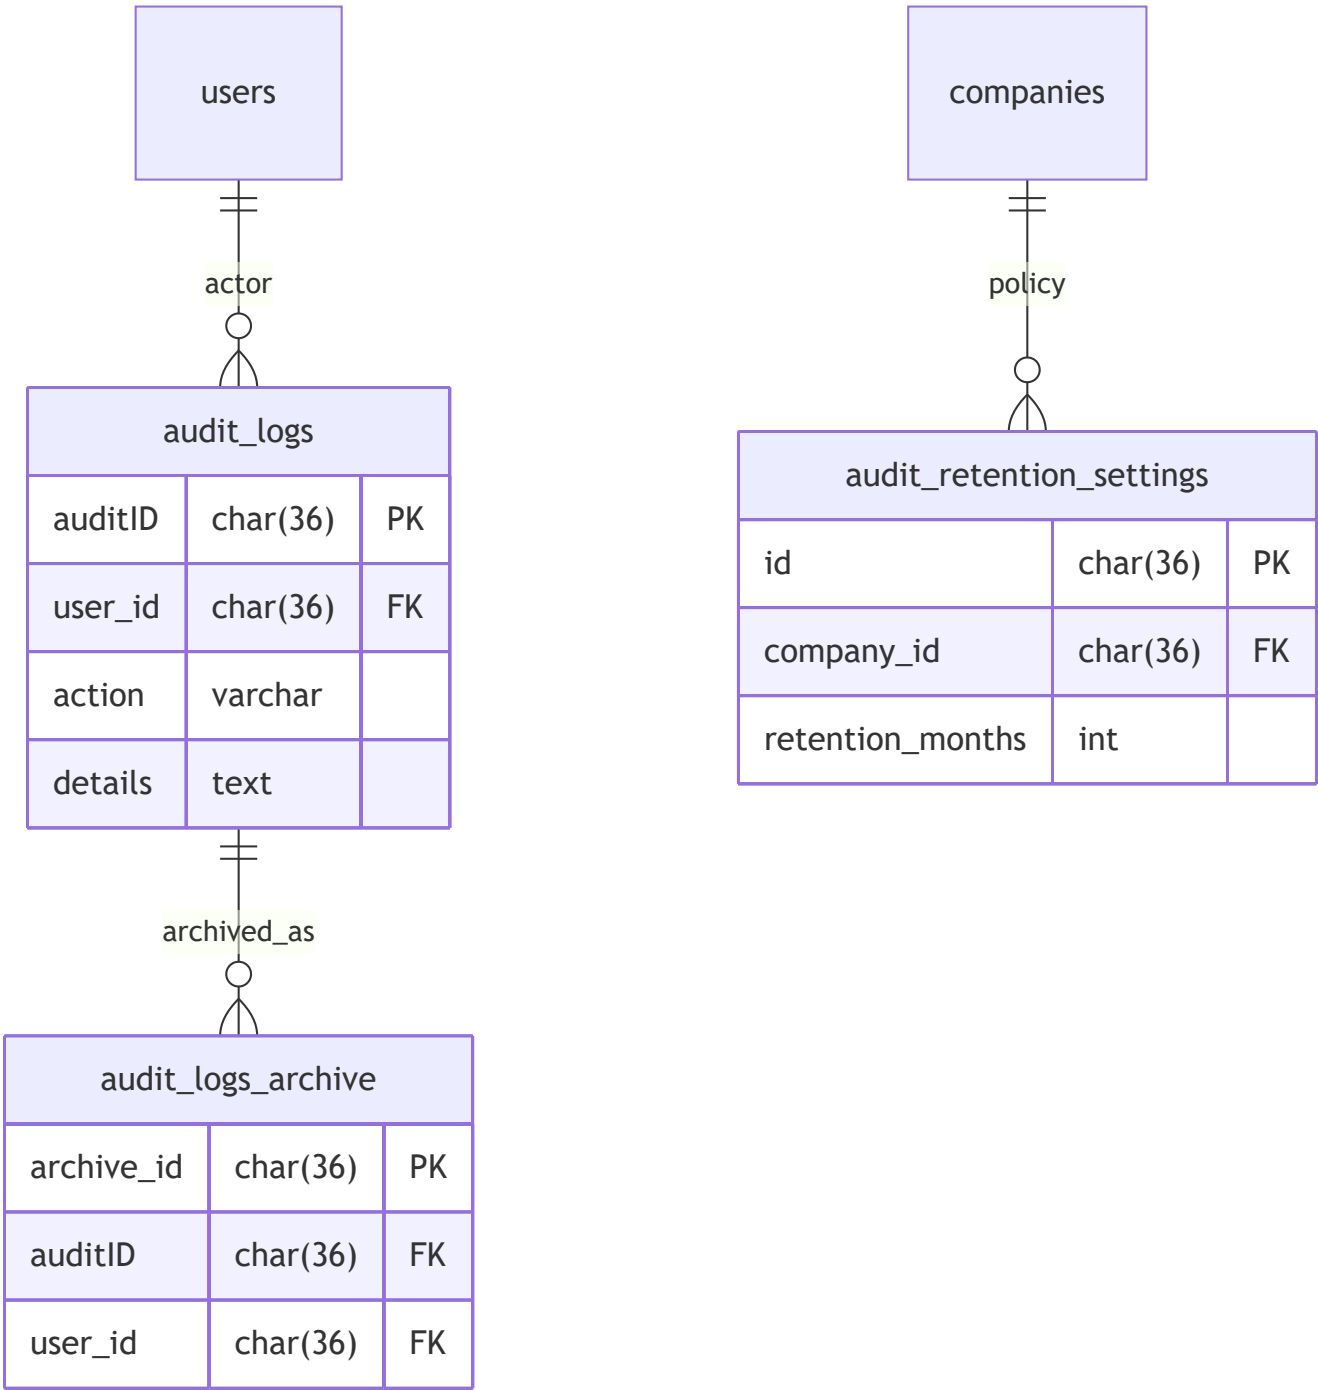

3) Requests and Gate Passes

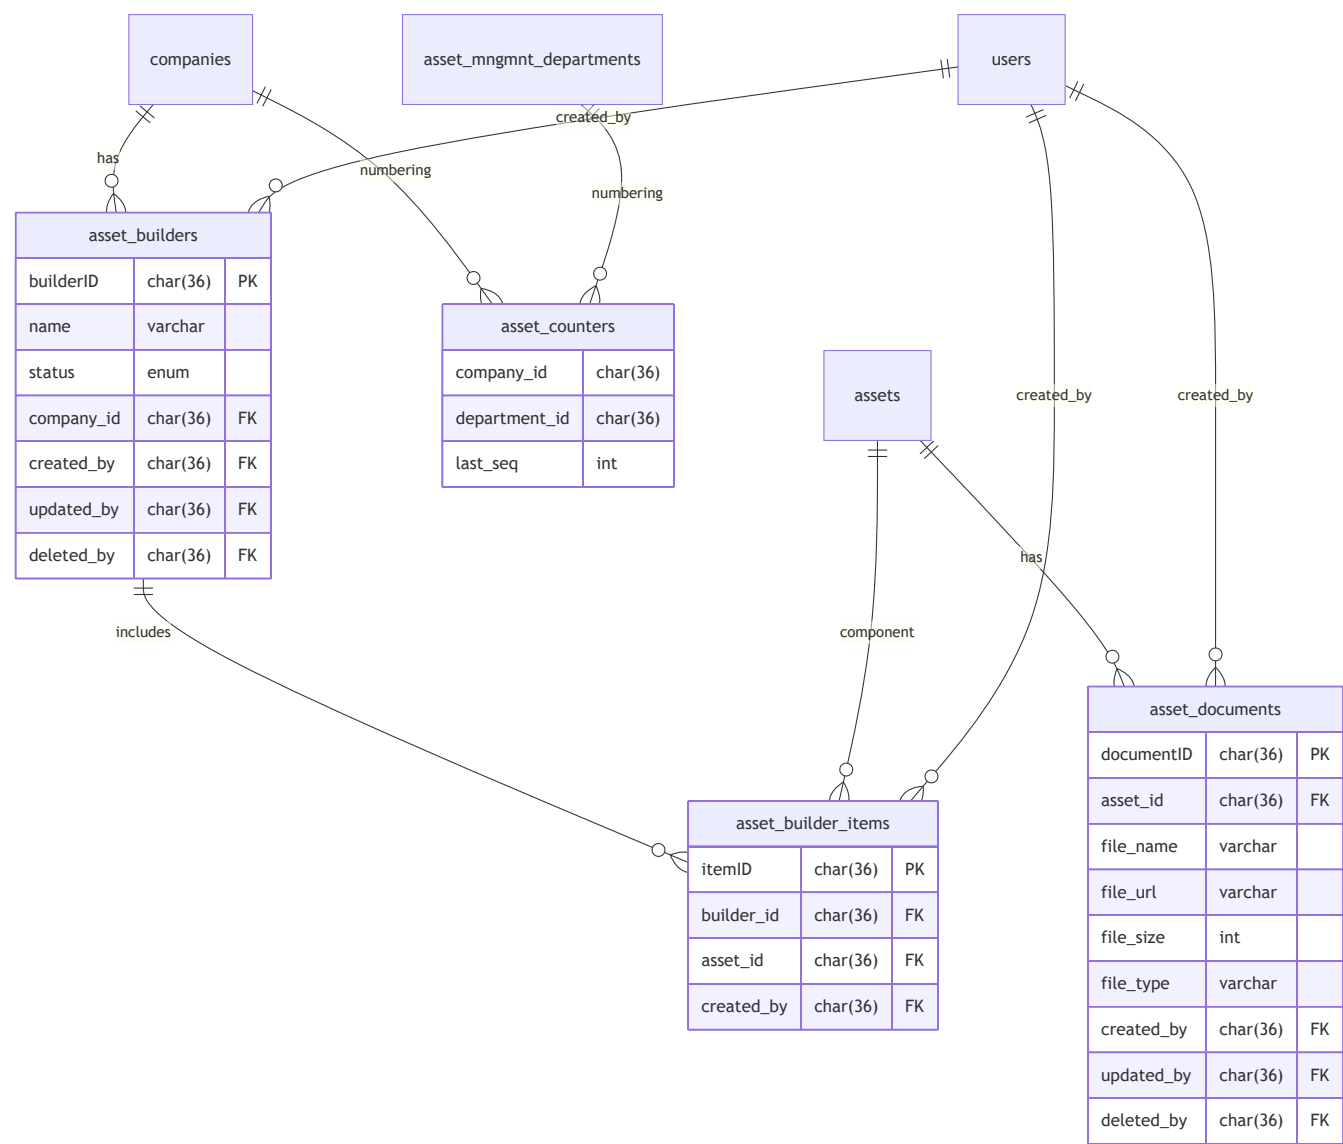

4) Roles and Permissions

5) Audit and Compliance

6) Asset Builder and Documents

Notes:

- asset_counters appears with company-only PK in some dumps and company+department in others; included here with both fields to reflect repository variability.

Rendering

- These diagrams are Mermaid erDiagram blocks and should render in supported Markdown viewers (e.g., GitHub, VS Code with Mermaid extensions).
- For very large diagrams, prefer viewing the module-focused sections instead of the master map.
